

## Overview

Diago have teamed up with George L's ([www.georgels.com](http://www.georgels.com)) to produce the highest quality guitar effects patch cables available, bar none. Add to that, the fact that they're compact, robust and custom lengths can be easily wired (and rewired) in seconds with no special tools, and you have the perfect wiring solution for your pedal board.

You buy a decent guitar and amp, good quality guitar cables and effects (true bypass or buffered) and yet your tone sounds like mushy crap. Why? The answer probably lies with your effects patch cables.

Cheap, pre-made patch cables can ruin a great guitar sound. Poor quality cables create muddiness and loss of clarity due to it's high capacitance and resulting high frequency roll-off.

Our patch cable and solderless right angled, nickel plated brass plugs, give maximum signal transmission, with a crystal-clear top end. It's also extremely flexible, so is ideal for use in tight spaces and withstands the toughest conditions. We generally recommend that it can be used in runs of anything up to 5 metres.

We can either send you the bits (it's very, very quick and easy), or we can make them up for you; the choice is yours! Visit our [Online Shop](#) to buy.

Right angled plugs are £4.75 each, and cable is £0.50 per 10cm.
